

Congenital Blue Nevus

FACTS:

- A congenital blue nevus is a blue birthmark present at birth. It may be light to dark blue in appearance and is usually flat to slightly raised.
- There is no way to prevent birthmarks.
- If pain, swelling, bleeding or itching of the blue nevus occurs, contact a doctor immediately.
- If the child has many blue nevi that have a rubber-like appearance and are raised over his or her body, they should be checked by a doctor for a rare disorder that may cause bleeding in the intestines. The child should be watched for developing pallor, anemia and blood in the stool. If these symptoms appear, see a doctor immediately.

Blue nevi are dark marks on the skin present at birth.

These marks are not painful and normally require little treatment.
